

PRESS RELEASE – 25 OCTOBER 2010

CLARANOR LAUNCHES ITS PULSED LIGHT CUP STERILIZATION SOLUTION DURING EMBALLAGE

During Emballage, taking place from the 22 to the 25th of november in Paris, Claranor will present its new equipment for cup sterilization prior to filling, for integration on production line.

This compact system brings a solution to sensitive refrigerated products manufacturers, using ultraclean and ESL packaging). For these products, a bacterial/mold development hazard linked with a residual packaging contamination exists. The concerned products are for instance dairy desserts, ready meals, fruit preparations...

Claranor decontamination unit enables to treat online, on one or several belts, preformed or FFS pots and cups of any size, depth or material.

Synchronised with the production rate, Claranor solution is an efficient, cost-effective and sustainable alternative to existing chemical technologies and irradiation treatments.
